

TABLE 3.8 Rules for Writing Formulas of Binary Ionic Compounds

Rules for Names	Examples	
	magnesium phosphide	aluminum bromide
1. Identify each ion and its charge.	magnesium: Mg^{+2} phosphide: P^{-3}	aluminum: Al^{+3} bromide: Br^{-1}
2. Determine the total charges needed to balance positive with negative.	$Mg^{+2}: +2 +2 +2 = +6$ $P^{-3}: -3 -3 = -6$	$Al^{+3}: = +3$ $Br^{-1}: -1 -1 -1 = -3$
3. Note the ratio of positive ions to negative ions.	3 Mg^{+2} ions for every 2 P^{-3} ions	1 Al^{+3} ion for every 3 Br^{-1} ions
4. Use subscripts to write the formula. Omit "1" where only one ion is needed.	Mg_3P_2	$AlBr_3$

Study Prep

1. Write the formulas of the ionic compounds containing the following ions:

- a) Na^{+1} with F^{-1}
 b) Mg^{+2} with Br^{-1}
 c) Cs^{+1} with S^{-2}
 d) Ba^{+2} with O^{-2}
 e) Ca^{+2} with P^{-3}

~~SKIP~~

2. Write the formulas of the following binary ionic compounds:

- a) potassium chloride _____
 b) strontium nitride _____
 c) silver sulphide _____
 d) zinc selenide _____
 e) beryllium sulphide _____
 f) rubidium oxide _____
 g) lithium nitride _____
 h) radium iodide _____
 i) aluminum phosphide _____
 j) magnesium sulphide _____
 k) lithium fluoride _____
 l) beryllium iodide _____
 m) magnesium oxide _____
 n) radium nitride _____
 o) potassium sulphide _____

3. Write the names of the following binary ionic compounds:

- a) CsI _____
- b) Ba₃N₂ _____
- c) CdCl₂ _____
- d) AlF₃ _____
- e) Li₂O _____
- f) K₂O _____
- g) Na₂O _____
- h) CaI₂ _____
- i) Sr₃P₂ _____
- j) CaO _____
- k) Cd₃N₂ _____
- l) RaBr₂ _____
- m) RbF _____
- n) AlCl₃ _____
- o) NaBr _____

Metals with More Than One Combining Capacity

An element that can form more than one stable ion is called a **multivalent** element. Most metals in the middle of the periodic table are multivalent. Their combining capacities are listed in the periodic table, with the most common one listed first. For example, iron can have either a +2 or a +3 ion, but the +3 ion is the most common. The symbols and names of the iron ions are:

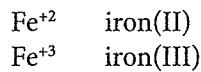

TABLE 3.9
Roman Numerals

Number	Roman Numeral
1	I
2	II
3	III
4	IV
5	V
6	VI
7	VII
8	VIII

Notice that the Roman numeral in the ion's name corresponds to the charge on the ion. A list of Roman numerals is given in Table 3.9.

Table 3.10 gives some examples of the names of binary ionic compounds containing a multivalent metal ion.

TABLE 3.10 Compounds with Multivalent Ions

Name	Formula
iron(III) iodide	FeI ₃
iron(II) iodide	FeI ₂
manganese(IV) sulphide	MnS ₂
copper(I) nitride	Cu ₃ N

Table 3.11 shows examples of how the compound's name is used to write the formula.

Study Prep

1. Write the names and formulas of the ionic compounds containing the following ions:

- a) Cu⁺¹ with S⁻² _____
- b) Cu⁺² with S⁻² _____
- c) Cr⁺² with F⁻¹ _____
- d) Cr⁺³ with F⁻¹ _____
- e) Fe⁺² with N⁻³ _____
- f) iron(III) ion with bromide ion _____
- g) lead(IV) ion with iodide ion _____
- h) lead(II) ion with iodide ion _____
- i) cobalt(III) ion with phosphide ion _____
- j) platinum(IV) ion with selenide ion _____

SKIP

2. Write the name of each ionic compound below. Remember to use a Roman numeral as part of the metal ion's name.

- a) FeCl₂ _____
- b) FeCl₃ _____
- c) Cu₂O _____
- d) CuO _____
- e) PbS _____
- f) PbS₂ _____
- g) MnBr₂ _____
- h) MnBr₃ _____
- i) Ti₃N₄ _____
- j) TiP _____
- k) SnF₂ _____
- l) TiS₂ _____
- m) Co₃N₂ _____
- n) PtI₂ _____
- o) Cu₃P _____

Continued

3. Write the formulas of the following ionic compounds:

- a) iron(II) iodide _____
- b) chromium(III) chloride _____
- c) copper(II) bromide _____
- d) mercury(II) oxide _____
- e) tin(IV) nitride _____
- f) tin(II) nitride _____
- g) titanium(III) phosphide _____
- h) gold(III) sulphide _____
- i) manganese(IV) iodide _____
- j) mercury(II) selenide _____
- k) gold(I) iodide _____
- l) titanium(IV) nitride _____
- m) manganese(IV) oxide _____
- n) cobalt(II) chloride _____
- o) chromium(III) bromide _____

Polyatomic Ions

Some ions are made up of several atoms joined together by sharing electrons, just like a molecule. The difference is that this combination of atoms has an electric charge. It can have either a positive or a negative charge. A **polyatomic ion** is a group of atoms that are covalently bonded and have an overall electric charge (“poly” means *many*).

In the compound NaOH, for example, the sodium has a charge of +1. The oxygen and hydrogen together form the polyatomic ion hydroxide (OH^{-1}), which has a charge of -1. Another example of a polyatomic ion is the phosphate ion (PO_4^{-3}). It is made up of one phosphorus atom and four oxygen atoms joined together. They behave like a single unit with a charge of -3.

Table 3.13 gives some examples of common polyatomic ions. Page 1 of the *Data Booklet* lists the names and formulas of these and other common ions.

There are a few points worth noting about the ions in Table 3.13:

- There are many more negative ions than positive ions.
- The most common positive polyatomic ion is ammonium (NH_4^{+1}). Ammonium phosphate is the most common fertilizer ingredient in the world.

Study Prep

1. Write the name of each compound below:

- a) Li_2CO_3 _____
- b) $\text{Mg}(\text{HCO}_3)_2$ _____
- c) Na_2SO_4 _____
- d) K_2SO_3 _____
- e) $\text{Ba}(\text{OH})_2$ _____
- f) $\text{Al}(\text{CN})_3$ _____
- g) $(\text{NH}_4)_3\text{PO}_4$ _____
- h) $\text{Fe}(\text{NO}_3)_2$ _____
- i) $\text{Mg}(\text{OH})_2$ _____
- j) Cu_3PO_4 _____
- k) Ag_2CrO_4 _____
- l) $\text{Rb}_2\text{Cr}_2\text{O}_7$ _____
- m) NH_4F _____
- n) $\text{Co}(\text{HSO}_3)_2$ _____

2. Write the formula for each compound below:

- a) sodium carbonate _____
- b) strontium chlorate _____
- c) cesium cyanide _____
- d) barium hydrogen carbonate _____
- e) zinc hydrogen sulphate _____
- f) strontium phosphate _____
- g) calcium hydroxide _____
- h) ammonium sulphide _____
- i) ammonium sulphate _____
- j) ammonium sulphite _____
- k) copper(II) nitrate _____
- l) chromium(III) hydrogen sulphide _____
- m) potassium dichromate _____
- n) sodium oxalate _____
- o) manganese(II) thiocyanate _____
- p) magnesium sulphite _____
- q) lead(II) perchlorate _____
- r) tin(IV) phosphate _____
- s) aluminum hydroxide _____
- t) beryllium carbonate _____

Table 3.18 gives some examples of how names of molecular compounds can be written from their formulas.

TABLE 3.18 Hints for Writing Names of Molecular Compounds

Formula	Name	Hints for Writing Names
CS ₂	carbon disulphide	Do not use a prefix when there is only one atom of the first element.
O ₂ F ₂	dioxygen difluoride	Do not reduce the name to “oxygen fluoride.”
CCl ₄	carbon tetrachloride	Do not use a prefix when there is only one atom of the first element.
P ₄ O ₁₀	tetraphosphorus decaoxide	Use rules 1 to 3.

Study Prep

1. Write the names of the following compounds:

- a) CO₂ _____
b) N₂O _____
c) PCl₃ _____
d) PBr₅ _____
e) SO₂ _____
f) N₂O₄ _____
g) P₄S₁₀ _____
h) S₂F₁₀ _____
i) NI₃ _____
j) NO _____

2. Write the formulas of the following compounds:

- a) nitrogen tribromide _____
b) sulphur hexafluoride _____
c) dinitrogen tetrasulphide _____
d) oxygen difluoride _____
e) carbon tetraiodide _____
f) sulphur trioxide _____
g) phosphorus pentachloride _____
h) diiodine hexachloride _____
i) dichlorine monoxide _____
j) xenon hexafluoride _____

1. Write the name of each compound below:

- Li_2CO_3 LITHIUM CARBONATE
- $\text{Mg}(\text{HCO}_3)_2$ MAGNESIUM BICARBONATE
- Na_2SO_4 SODIUM SULFATE
- K_2SO_3 POTASSIUM SULFITE
- $\text{Ba}(\text{OH})_2$ BARIUM HYDROXIDE
- $\text{Al}(\text{CN})_3$ ALUMINUM CYANIDE
- $(\text{NH}_4)_3\text{PO}_4$ AMMONIUM PHOSPHATE
- $\text{Fe}(\text{NO}_3)_2$ IRON (II) NITRATE
- $\text{Mg}(\text{OH})_2$ MAGNESIUM HYDROXIDE
- Cu_3PO_4 COPPER (I) PHOSPHATE
- Ag_2CrO_4 SILVER CHROMATE
- $\text{Rb}_2\text{Cr}_2\text{O}_7$ RUBIDIUM DICHRONATE
- NH_4F AMMONIUM FLUORIDE
- $\text{Co}(\text{HSO}_3)_2$ COBALT (II) BISULFITE

2. Write the formula for each compound below:

- sodium carbonate Na_2CO_3
- strontium chlorate $\text{Sr}(\text{ClO}_3)_2$
- cesium cyanide ~~— OMIT —~~
- barium hydrogen carbonate $\text{Ba}(\text{HCO}_3)_2$
- zinc hydrogen sulphate $\text{Zn}(\text{HSO}_4)_2$
- strontium phosphate $\text{Sr}_3(\text{PO}_4)_2$
- calcium hydroxide $\text{Ca}(\text{OH})_2$
- ammonium sulphide $(\text{NH}_4)_2\text{S}$
- ammonium sulphate $(\text{NH}_4)_2\text{SO}_4$
- ammonium sulphite $(\text{NH}_4)_2\text{SO}_3$
- copper(II) nitrate $\text{Cu}(\text{NO}_3)_2$
- chromium(III) hydrogen sulphide $\text{Cr}(\text{HS})_3$
- potassium dichromate $\text{K}_2\text{Cr}_2\text{O}_7$
- sodium oxalate $\text{Na}_2\text{C}_2\text{O}_4$
- manganese(II) thiocyanate ~~— OMIT —~~
- magnesium sulphite MgSO_3
- lead(II) perchlorate $\text{Pb}(\text{ClO}_4)_2$
- tin(IV) phosphate $\text{Sn}_3(\text{PO}_4)_4$
- aluminum hydroxide $\text{Al}(\text{OH})_3$
- beryllium carbonate BeCO_3

Table 3.18 gives some examples of how names of molecular compounds can be written from their formulas.

TABLE 3.18 Hints for Writing Names of Molecular Compounds

Formula	Name	Hints for Writing Names
CS ₂	carbon disulphide	Do not use a prefix when there is only one atom of the first element.
O ₂ F ₂	dioxygen difluoride	Do not reduce the name to "oxygen fluoride."
CCl ₄	carbon tetrachloride	Do not use a prefix when there is only one atom of the first element.
P ₄ O ₁₀	tetraphosphorus decaoxide	Use rules 1 to 3.
